Limitations of the NGS technology?

1. Probe coverage :

   Target DNA covered? Optimal capture?

Not covered

=> NO sequences obtained in this region

=> mutation will be missed!

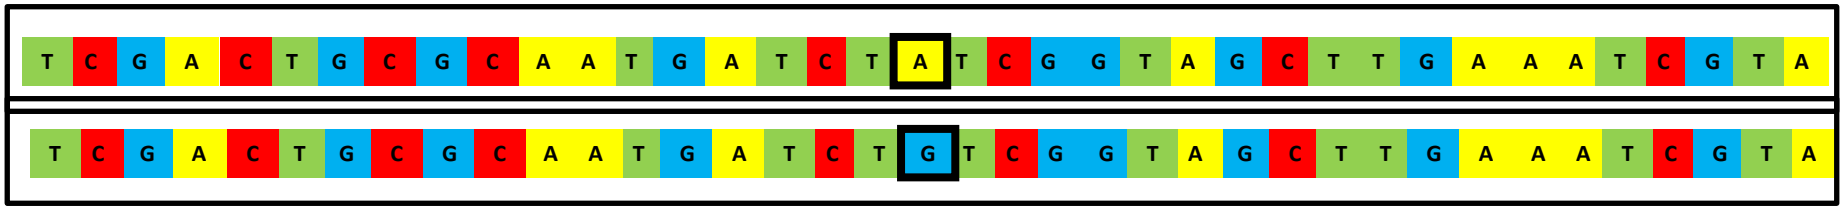
Technical difficulties:

GC-rich regions, repetitive sequences, pseudogenes, homologous regions,…

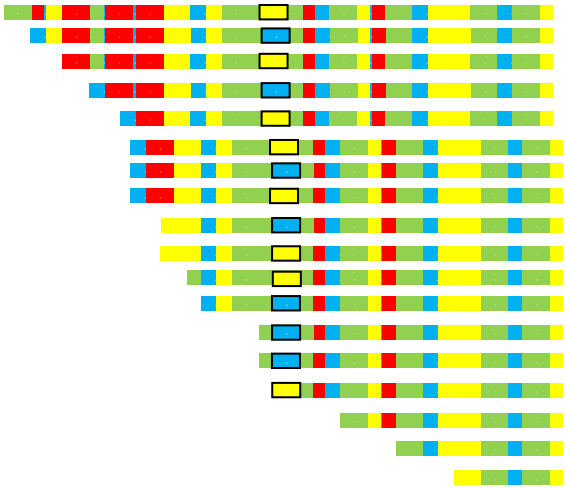
Limitations of the NGS technology?

2. Sequencing depth :

Number of reads which cover a target sequence?



PATIENT

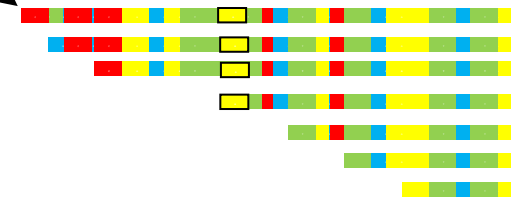


Sequencing depth = 15 x

8 = A

7 = G

⇒ **mutation**



Sequencing depth = 4 x

4 = A

G missed !

⇒ **false negative**

Limitations of the NGS technology?

3. Alterations which does not alter the coding nuclear DNA sequence:

1. Deep intronic mutations
   Promotor and regulatory sequences mutations
2. Uniparental disomy
3. Epigenetic alterations (imprinting disorders)
4. Trinucleotide repeat expansion diseases
5. Mitochondrial diseases

Examples of NGS limitations in perinatal setting

KU LEUVEN

FLOPPY INFANT

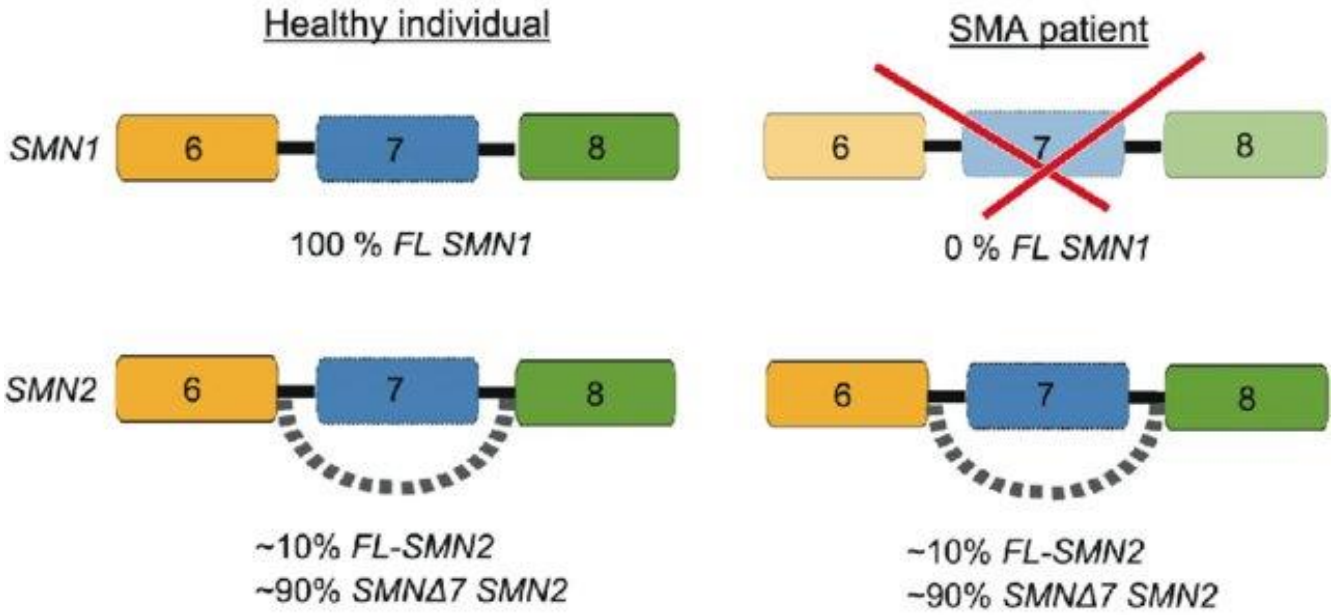
EXOME IN TRIO IS NORMAL

What do you miss ?

Case 1

- Severe hypotonia
- Severe respiratory distress
  with paradoxical breathing
- Good visual contact

Suspicion of … Spinal Muscular Amyotrophy



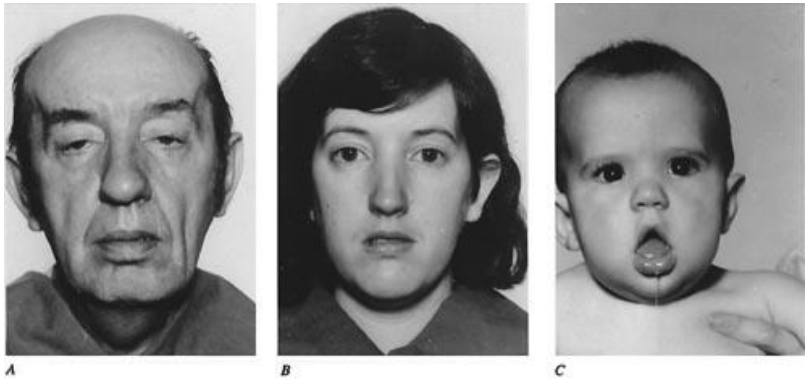
Bowerman M. et al, Disease Models and Mechanisms, 2017

2 difficulties for NGS detection:

- Small deletion
- Pseudogene SMN2

Treatment !!!

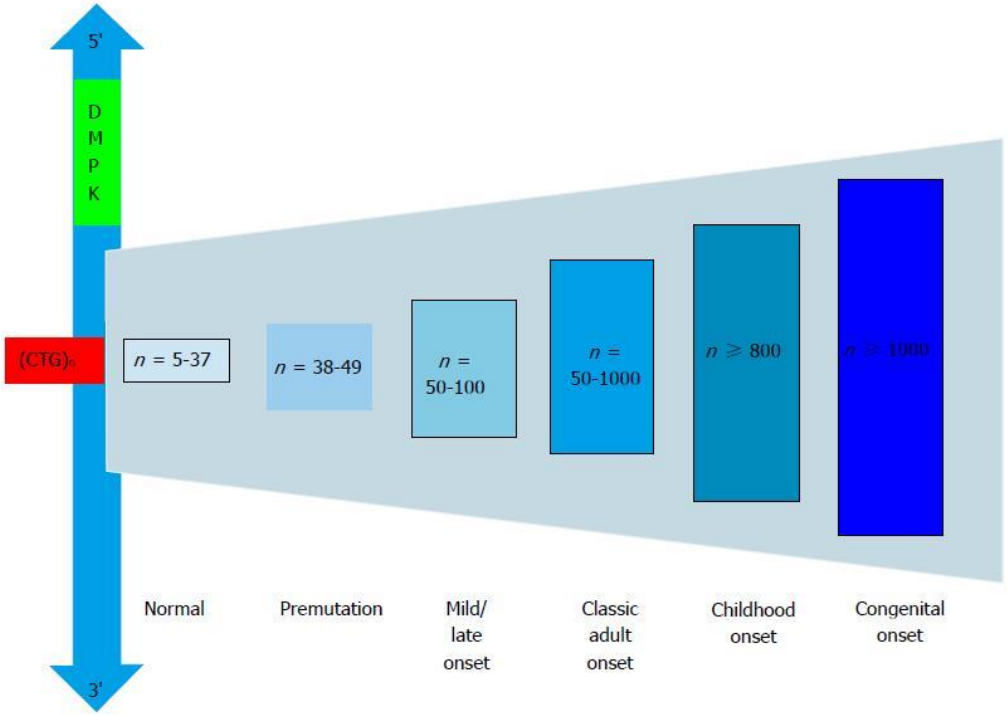
Case 2

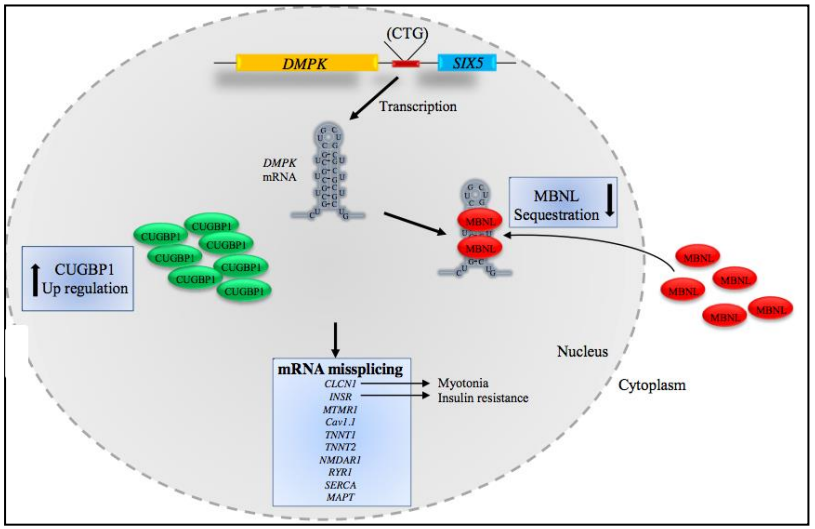


Anticipation in maternal transmission

- Severe hypotonia
- Feeding difficulties
- Respiratory deficiency
- Feet equinus deformity
- Familial history of muscle weakness, myotonia, balding and cataract

Suspicion of … Myotonic dystrophy type1 (congenital Steinert disease)





Santoro M. et al, 2015

Difficulty for NGS detection:

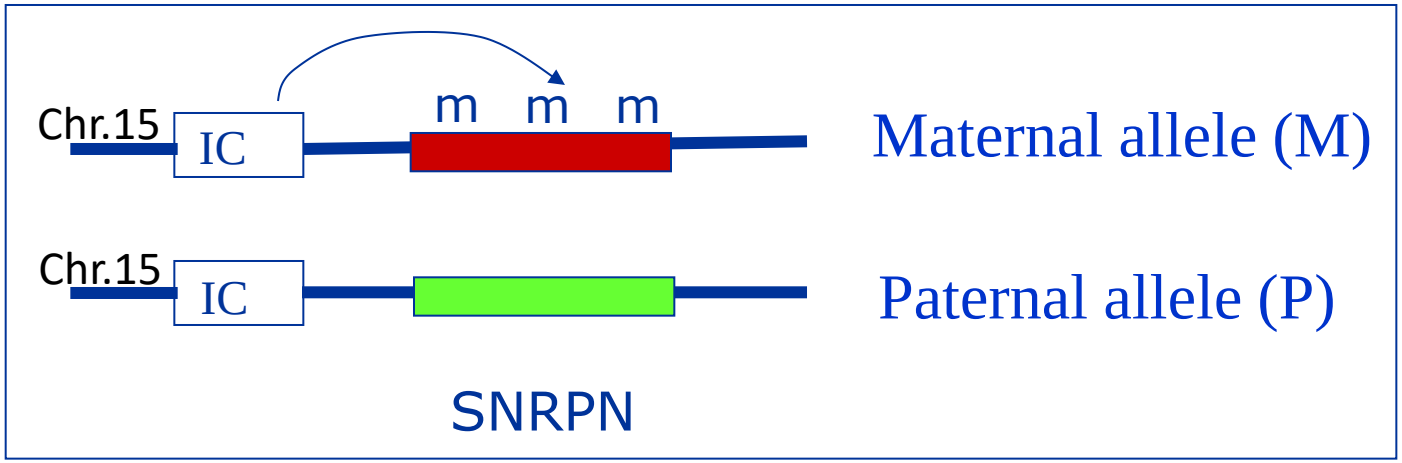
- Trinucleotides repeat expansion

Diagnosis, prognosis,
preventive follow-up and genetic counselling

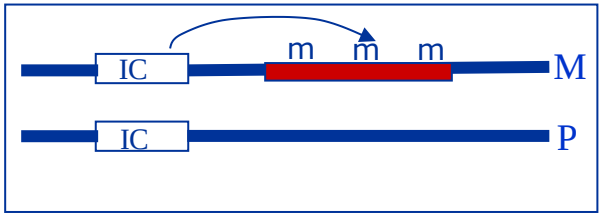
Case 3

- Severe hypotonia
- Feeding difficulties
- No familial history

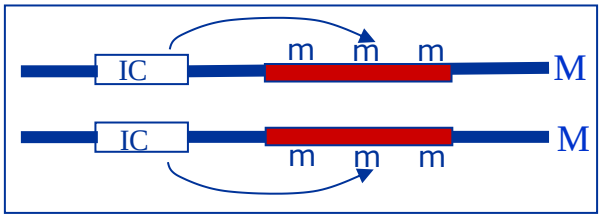
Suspicion of … Prader-Willi syndrome



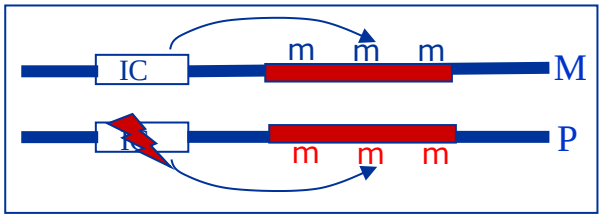
Paternal allele deletion **70%**



Maternal uniparental disomy **25-30%**



Imprinting center or epigenetic defect **<5%**

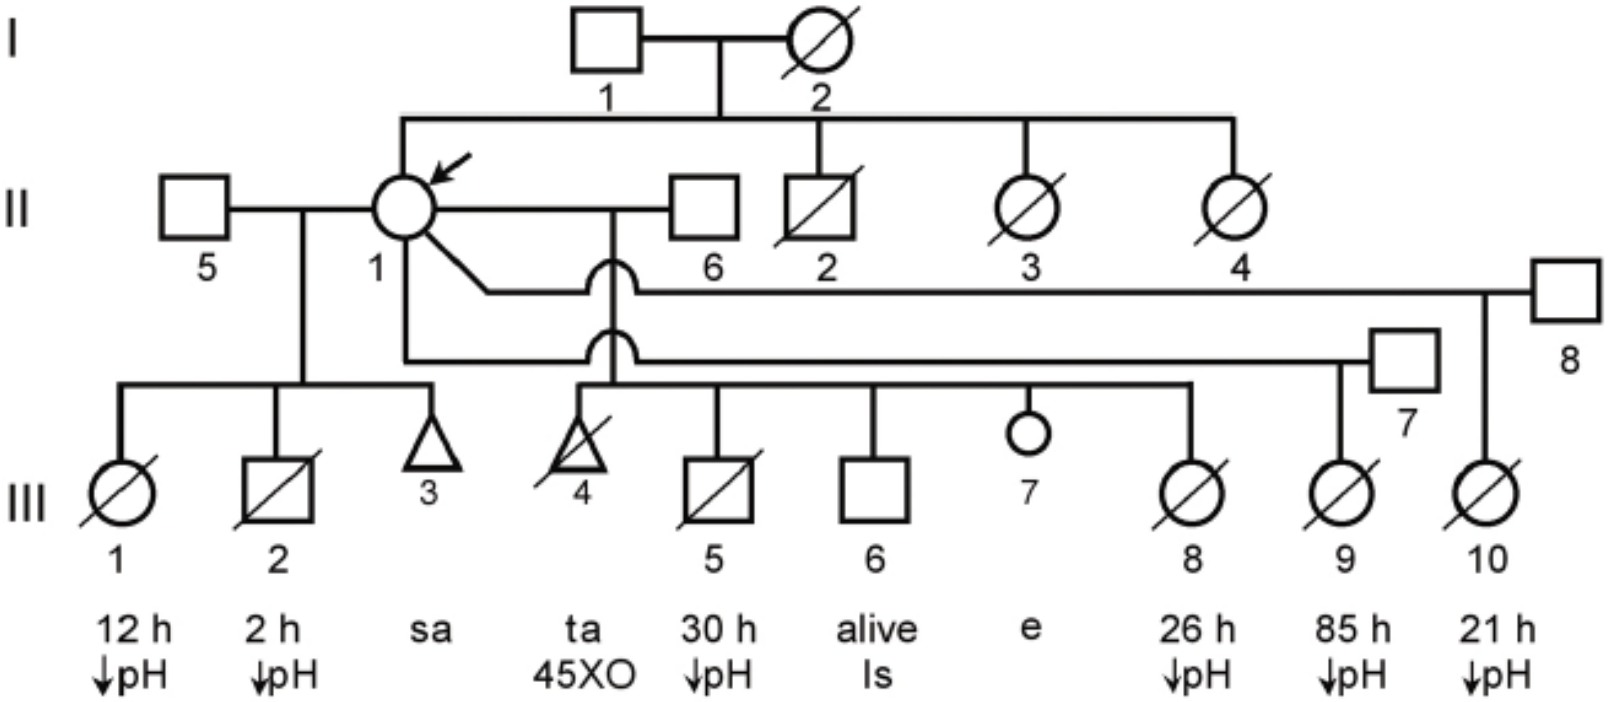


Difficulties for NGS detection:

- Small deletions (CNVs detection)
- Uniparental disomies
- Epigenetic defects (imprinting disorder)

Diagnosis, <u>preventive follow-up</u>
and genetic counselling

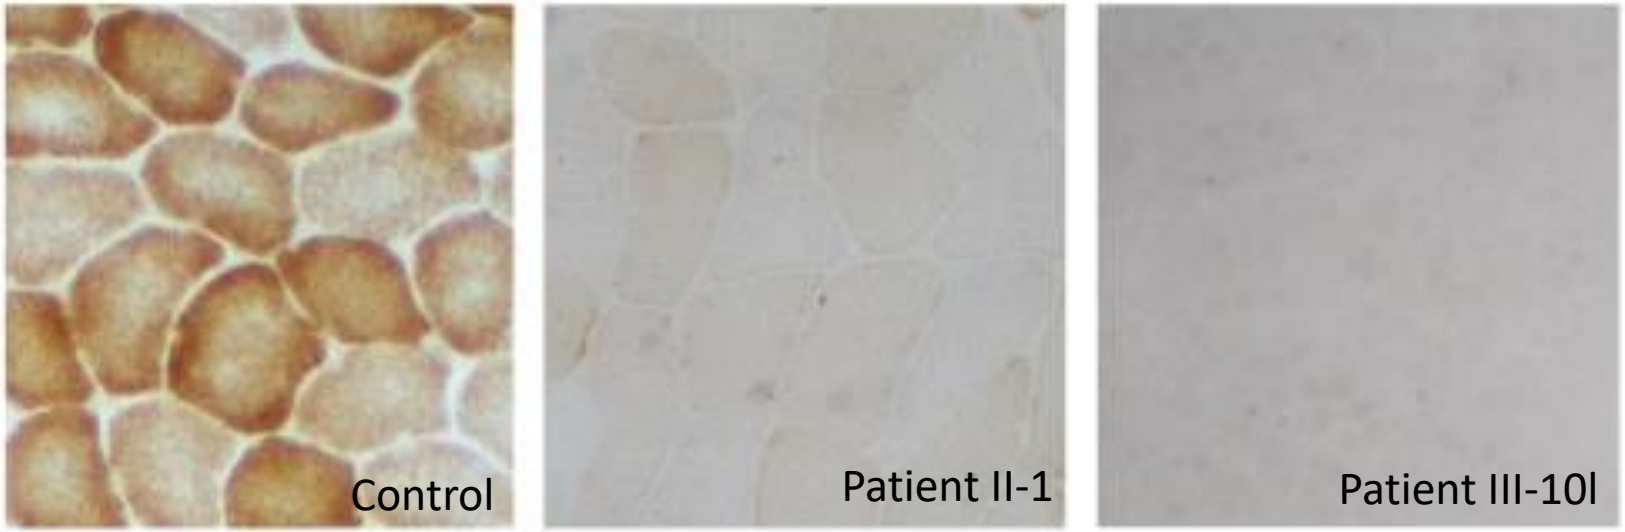
Case 4



McFarland R. et al, Nat Genet 2002

- 6 neonatal deaths and 1 surviving child with Leigh syndrome
- Severe hypotonia
- Lactic acidosis
- Multiple organe failure

Suspicion of … Mitochondrial disease



Low cytochrom c oxidase activity of skeletal muscle sections of affected patients
Homoplasmic C1624T within the mt-tRNA^{Val} gene

McFarland R. et al, Nat Genet 2002

Difficulty for NGS detection:

- mtDNA mutations are not well covered
- mtDNA mutations may be absent in a blood sample

- *No hydrops fetalis*

- **error at CVS?**
  - no maternal contamination
  - no sample swaps
- **Different type of fetal akinesia ?**
  - different manifestations:

    earlier, no polyhydramnios, no hydrops

Re-analysis of parental sequences

KLHL41
Homozygous mutation c.171C>A p.Tyr57*

Identification of KLHL41 Mutations Implicates BTB-Kelch-Mediated Ubiquitination as an Alternate Pathway to Myofibrillar Disruption in Nemaline Myopathy

Nemaline myopathy (NM) is a rare congenital muscle disorder primarily affecting skeletal muscles that results in neonatal death in severe cases as a result of associated respiratory insufficiency. NM is thought to be a disease of sarcomeric thin filaments as six of eight known genes whose mutation can cause NM encode components of that structure, however, recent discoveries of mutations in non-thin filament genes has called this model in question. We performed whole-exome sequencing and have identified recessive small deletions and missense changes in the Kelch-like family member 41 gene (KLHL41) in four individuals from unrelated NM families. Sanger sequencing of 116 unrelated individuals with NM identified compound heterozygous changes in KLHL41 in a fifth family. Mutations in KLHL41 showed a clear phenotype-genotype correlation: Frameshift mutations resulted in severe phenotypes with neonatal death, whereas missense changes resulted in impaired motor function with survival into late childhood and/or early adulthood. Functional studies in zebrafish showed that loss of Klhl41 results in highly diminished motor function and myofibrillar disorganization, with nemaline body formation, the pathological hallmark of NM. These studies expand the genetic heterogeneity of NM and implicate a critical role of BTB-Kelch family members in maintenance of sarcomeric integrity in NM.

KLHL41
Homozygous mutation c.171C>A p.Tyr57*

This gene was not yet in the fetal akinesia panel at the time of testing !

ACMG STANDARDS AND GUIDELINES | Genetics inMedicine

Standards and guidelines for the interpretation of sequence variants: a joint consensus recommendation of the American College of Medical Genetics and Genomics and the Association for Molecular Pathology

Sue Richards, PhD[1], Nazneen Aziz, PhD[2,16], Sherri Bale, PhD[3], David Bick, MD[4], Soma Das, PhD[5], Julie Gastier-Foster, PhD[6,7,8], Wayne W. Grody, MD, PhD[9,10,11], Madhuri Hegde, PhD[12], Elaine Lyon, PhD[13], Elaine Spector, PhD[14], Karl Voelkerding, MD[13] and Heidi L. Rehm, PhD[15]; on behalf of the ACMG Laboratory Quality Assurance Committee

Disclaimer: These ACMG Standards and Guidelines were developed primarily as an educational resource for clinical laboratory geneticists to help them provide quality clinical laboratory services. Adherence to these standards and guidelines is voluntary and does not necessarily assure a successful medical outcome. These Standards and Guidelines should not be considered inclusive of all proper procedures and tests or exclusive of other procedures and tests that are reasonably directed to obtaining the same results. In determining the propriety of any specific procedure or test, the clinical laboratory geneticist should apply his or her own professional judgment to the specific circumstances presented by the individual patient or specimen. Clinical laboratory geneticists are encouraged to document in the patient's record the rationale for the use of a particular procedure or test, whether or not it is in conformance with these Standards and Guidelines. They also are advised to take notice of the date any particular guideline was adopted and to consider other relevant medical and scientific information that becomes available after that date. It also would be prudent to consider whether intellectual property interests may restrict the performance of certain tests and other procedures.

Take-home message

1. **NGS can be a good diagnostic tool**
   - Good clinical information is crucial
   - Trio strategy and familial segregation studies
   - Parental consent (! Incidental findings)

   But interpretation of the variants remains challenging

   (international databases, collaborative research, …)

2. **Screening tool?**

   ↑ therapeutic perspectives in the future…

3. **Poor predictive value for multifactorial diseases**

   (autism spectrum disorders, psychiatric diseases,…)
