DARIS Pc 13.9%; RR 20%; alpha 2.5%; beta 10%; diversity 0% is a Two-sided graph

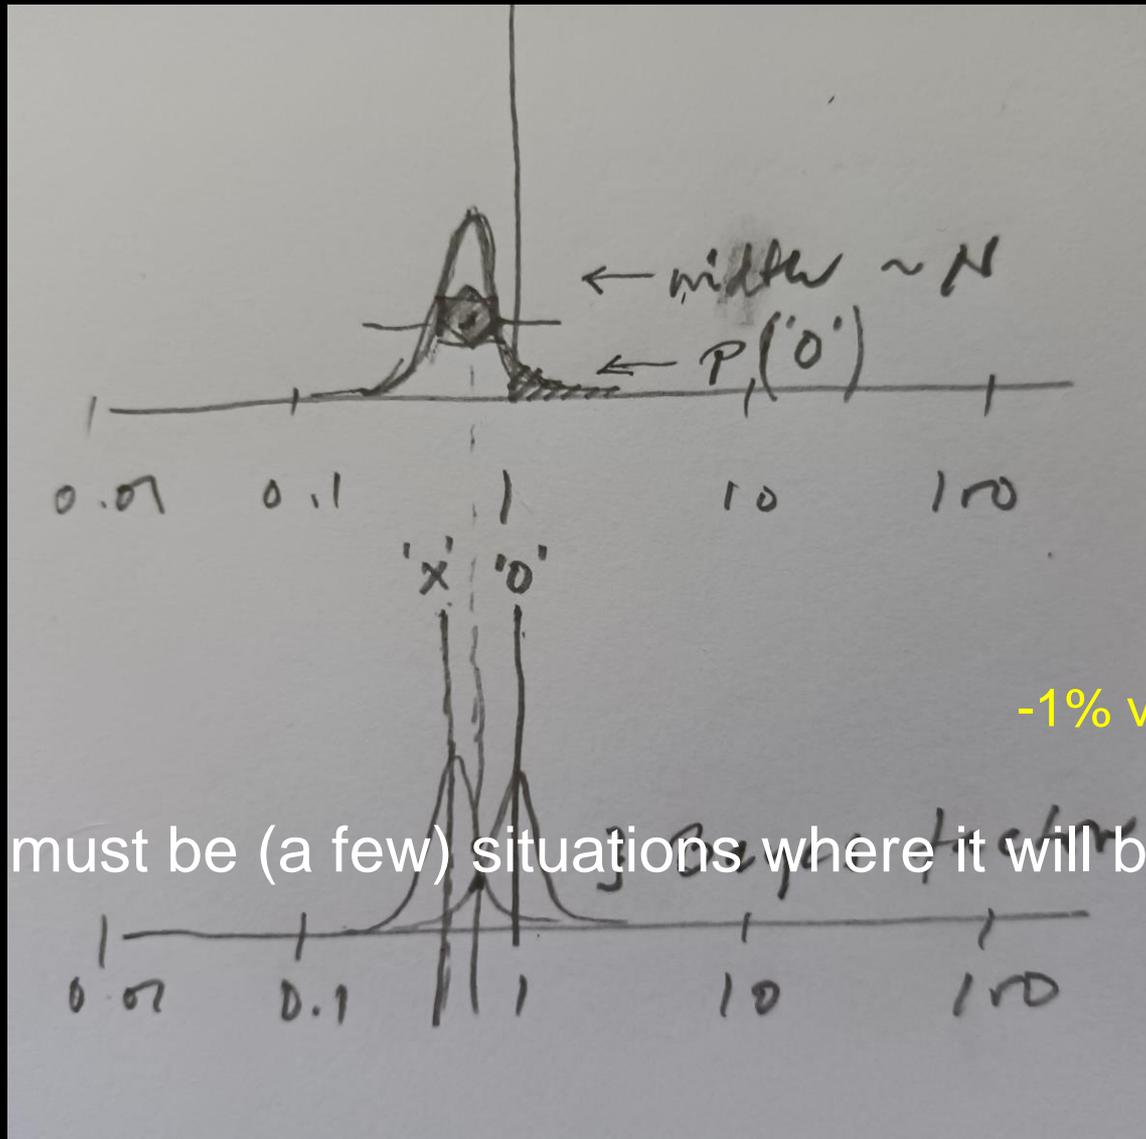

The play of chance: could the effect be -1% risk?

-1% vs 'null' = 0,91

The play of chance: could the effect be -1% risk?

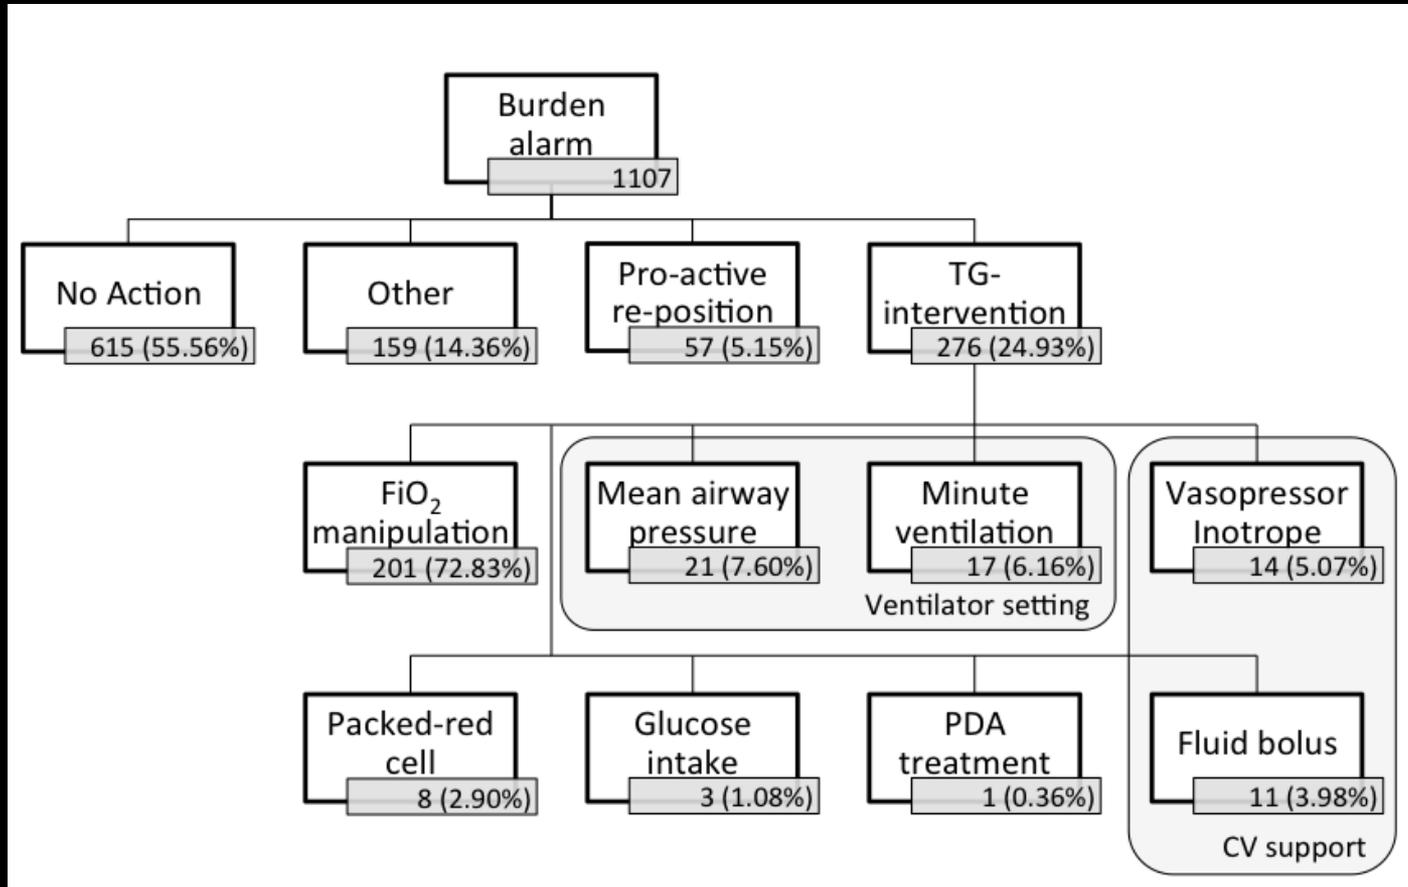

-1% vs 'null' = 0,91

& there must be (a few) situations where it will be helpful !?

But why did it not work?  
*(as well as we thought it would)*

- Staff did not react to alarms
- Staff did not know what to do
- Oxymeters are not very precise
- Accuracy is uncertain
- The hypoxic threshold was wrong
- Brain hypoxia is not so important

## About this page

In the grid below you'll find information from the Trial organising committee, trial protocol and data collection forms. Clicking on the appropriate image will take you to the e-learning to be completed before participating in the trial. You can find a forum where you can ask questions of other trial investigators, nurses and the trial organising committee.

<https://www.trialeducation.info/>

# The modules

Based on your clinical position, we recommend that you complete the following modules:

- 1) Nurses: introduction, NIRS
- 2) Neonatologists/residents: introduction, NIRS, treatment guideline, cUS
- 3) Radiologists: cUS
- 4) Principal investigators: introduction, NIRS, treatment guideline, cUS, Good Clinical Practice

SAFEGUARDING THE BRAIN OF OUR SMALLEST CHILDREN

# Feasibility of the web-based training and certification of clinical staff for the randomised clinical trial SafeBoosC-III

MI Rasmussen, ML Hansen, G Greisen on behalf of the SafeBoosC consortium

Department of Neonatology, Rigshospitalet, Denmark

## Aim

SafeBoosC-III is a pragmatic, multinational randomised clinical trial evaluating the effects of treatment guided by cerebral oximetry monitoring in extremely preterm infants. In total, 1601 infants were randomised across 70 centres in Asia, Europe, and North America. To heighten the quality of trial data and patient care, we developed a multilingual web-based training program, to train trial staff members and test their competencies, efficiently and consistently.

Mean certification rates over time per centre

## RESEARCH SUMMARY

Nov-3 2022

## Early Amino Acids in Extremely Preterm Infants and Neurodisability at 2 Years

Bloomfield FH et al. DOI: 10.1056/NEJMoa2204886

### CLINICAL PROBLEM

The appropriate protein intake to support the growth and development of infants with extremely low birth weight is unknown. Findings from observational studies that suggested improved outcomes with higher protein intake led to recommendations for early higher intake of amino acids, but data from randomized, controlled trials are lacking.

### CLINICAL TRIAL

**Design:** A multicenter, double-blind, randomized, controlled trial examined whether early higher intake of amino acids would improve outcomes in infants with extremely low birth weight.

**Intervention:** 434 infants with a birth weight of less than 1000 g (217 infants per group) were assigned to receive, in addition to usual parenteral nutrition, an extra 1 g of amino acids per day or placebo through an umbilical artery catheter for a period of 5 days starting within 24 hours after birth. The primary outcome was survival free from any neurodisability at 2 years of age, corrected for gestational age at birth.

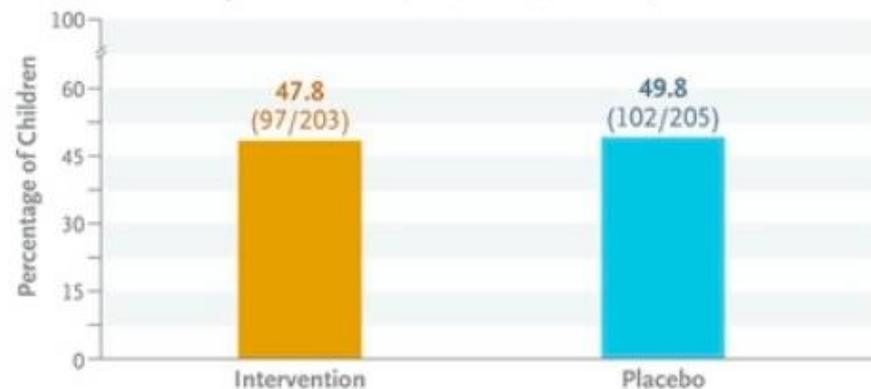

### RESULTS

The proportion of participants alive and free from neurodisability at a corrected age of 2 years did not differ sig-
