

A little more than just IUGR

Goele Nys

Neonatologist UMC Sint-Pieter Brussel

28 november 2024

Herfstvergadering BVN-Réunion d'automne GBN

Brief discussion during prenatal round

- Young parents in good health
- G1P0
- Origin: **Afghanistan**, since 2015 in Belgium
- **Consanguinity: yes**, cousins
- NIPT normal XY, serology nl, no diabetes/HTA/thyroid problems
- Prenatal ultrasounds:
 - T1 nl
 - T2 morphology nl
 - **T3 (32w) IUGR stade 0 → (35w) stade 1; morphology nl (weight estimated at 1825g)**

'Just IUGR'

Induction at 37w GA

Delivery

- 37+1w GA
- Vaginal delivery, head position, clear amniotic fluid
- Apgar 2-5-7
- Needs **2x 5 insufflations, 2 min of ventilations, on CPAP PEEP 6, FiO2 30%**
- pH 7,22 – BE -12 – lact 5,7 – glyc 75
- ➔ Recovers clinically quickly
- ➔ But ...

**Genu
recurvatum**

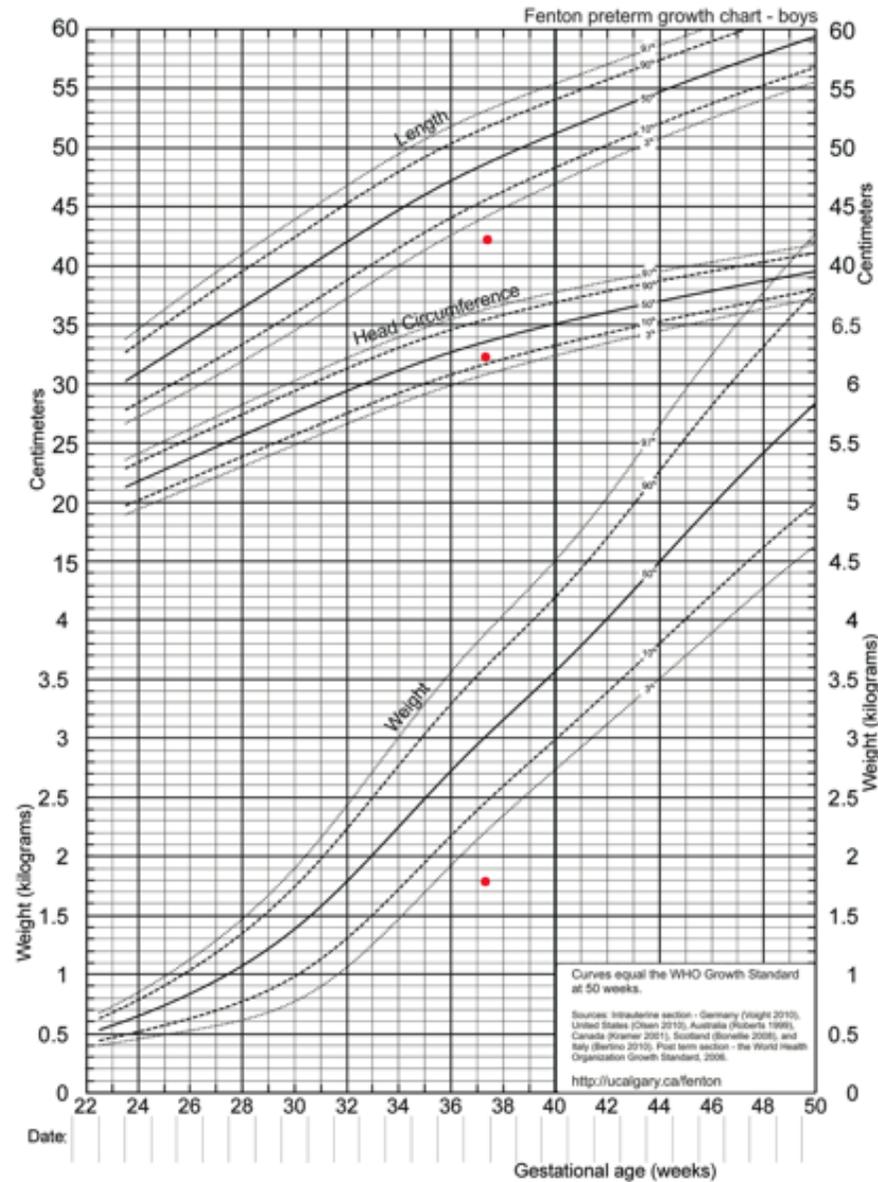

- Normal cardio-pulmonary auscultation
- Abdomen normal
- Tonus normal, reflexes normal
- No clear hyperlaxity of other joints
- **Bilateral cryptorchidism**

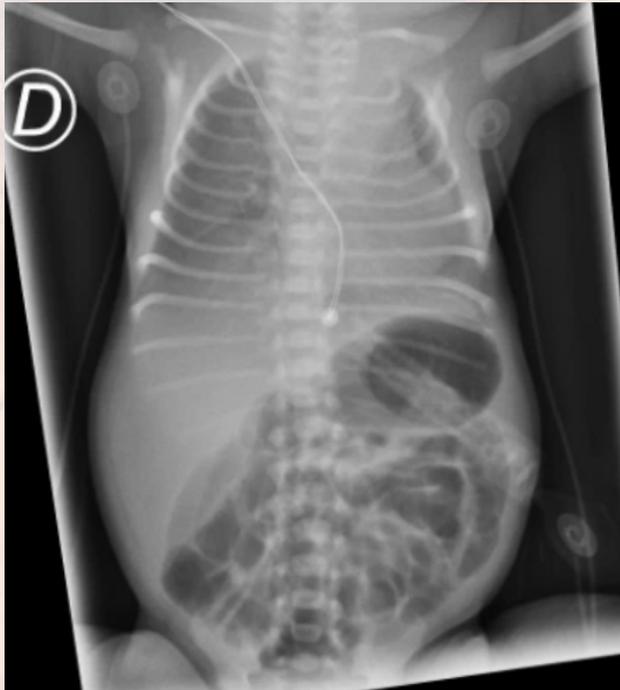

Biometrics

At 37+1w GA

- Weight: 1830g
 - Length: 42cm
 - HC: 32cm
- ➔ Brain sparing

X-ray day 1

- Transient tachypnea?
- CPAP PEEP 6 FiO 21%

Orthopedic evaluation:

- Luxation of knee joints
- Plaster for at least 3 weeks

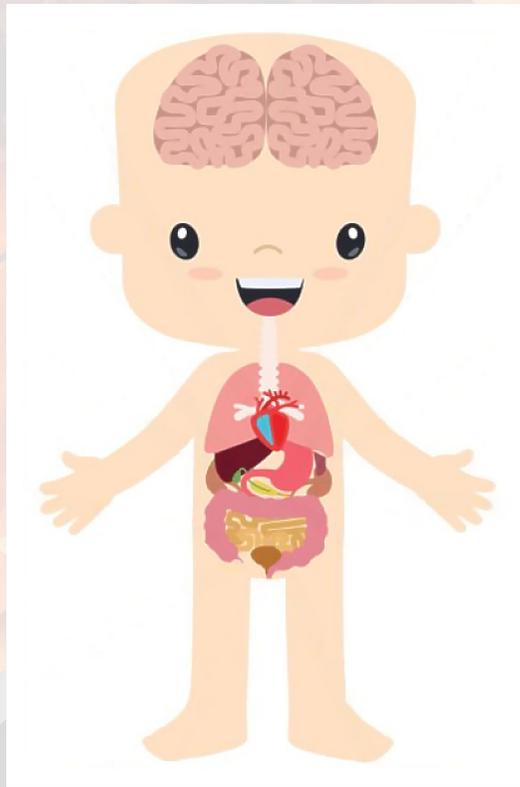

Malformation assessment first days of life

- **Blood:** Hb 15,3g/dL, WB 14000/mm³, PLT 240 000/mm³, CRP <0,6mg/L, normal kidney/liver function, normal electrolytes
- **Brain** ultrasound: normal
- **Cardiac** ultrasound: normal
- **Abdominal** ultrasound: normal
- An email to **genetics** ...

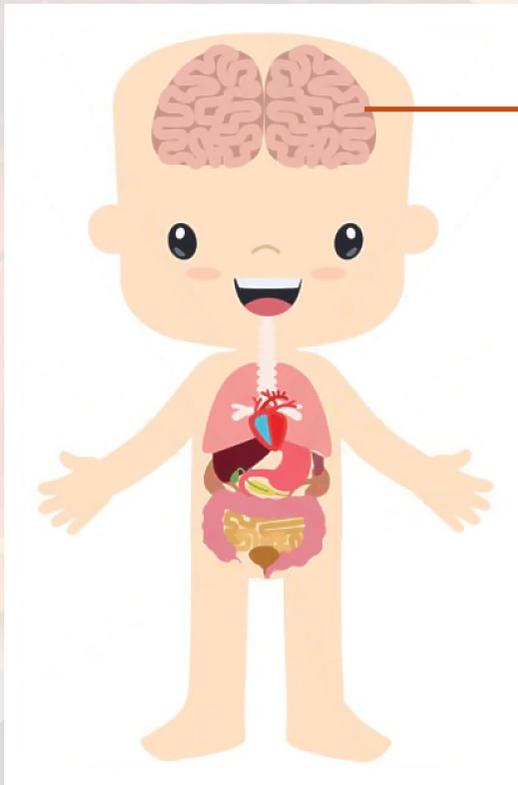

Differential diagnosis

- Asphyxiating thoracic dystrophy (Jeune syndrome)
 - Connective tissue disease (Ehlers-Danlos)
 - Myopathie
 - Skeletal dysplasia, dwarfism
- ➔ Genetics: CGH, panel thoracic dysplasia, WES in trio

From birth till 44w GA ...

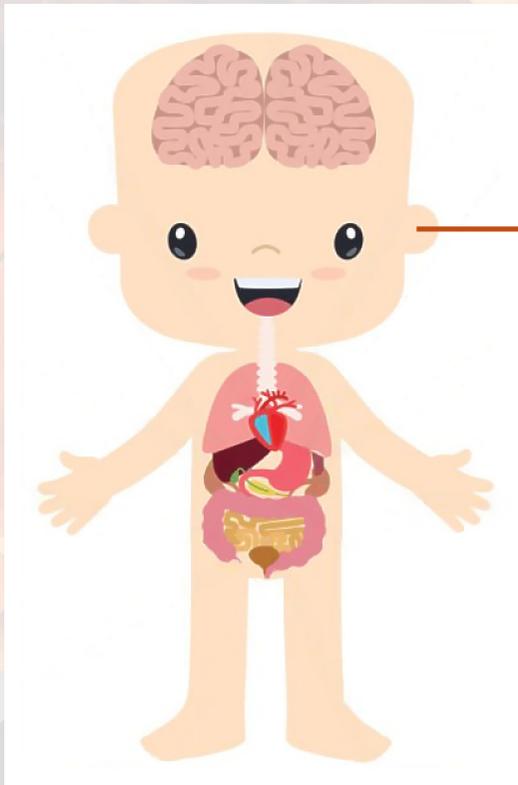

From birth till 44w GA ...

Neurological

- Ultrasound & MRI brain normal
- EEG normal
- Evaluation neurologist
 - Mild axial hypotonia, normal movements, normal reflexes, normal contact.
 - CK (day 30): normal

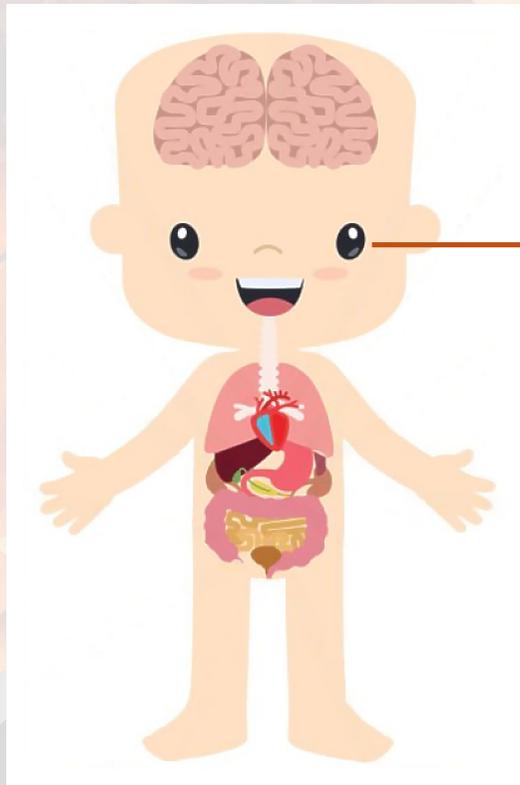

From birth till 44w GA ...

ENT

- Fibroscopy normal: no laryngomalacia, no upper-airway obstruction, no cleft palate, mild GER
- BERA abnormal, thresholds 60-80dB

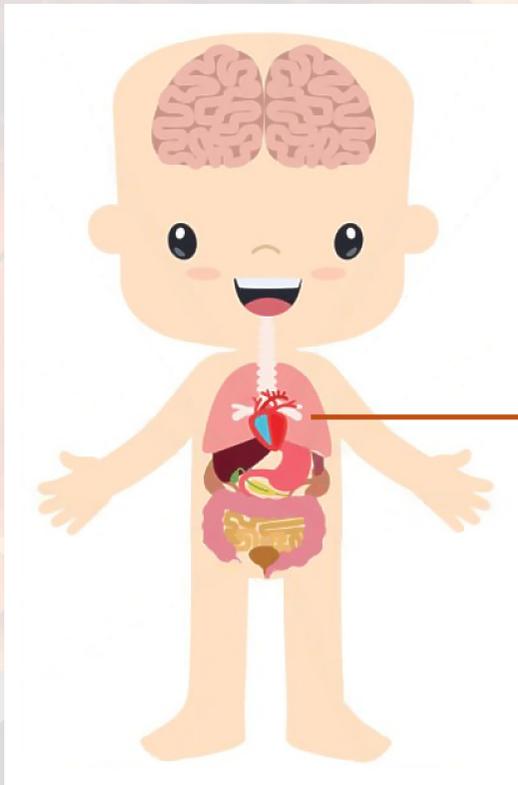

From birth till 44w GA ...

Ophtalmologic

- Evaluation normal

From birth till 44w GA ...

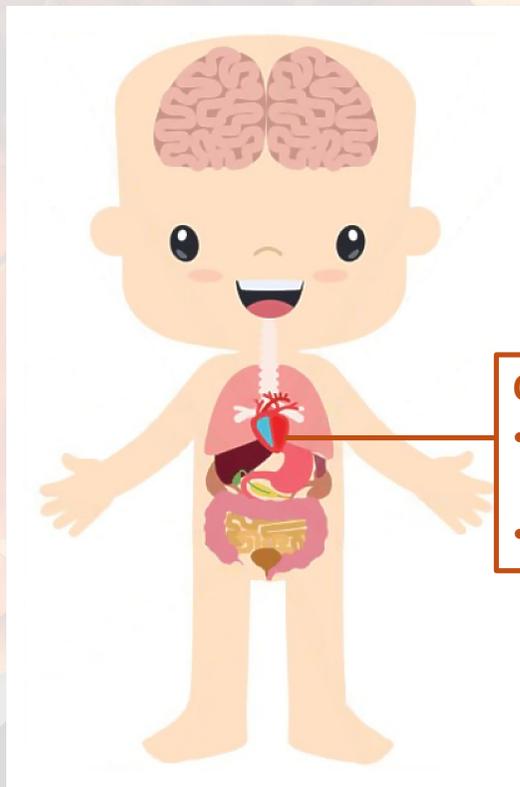

Respiratory

- Respiratory insufficiency
 - ➔ Failure of high flow, need for continuous CPAP PEEP 6
 - ➔ FiO2 21%
- X-ray day 14
- Evaluation pulmonologist

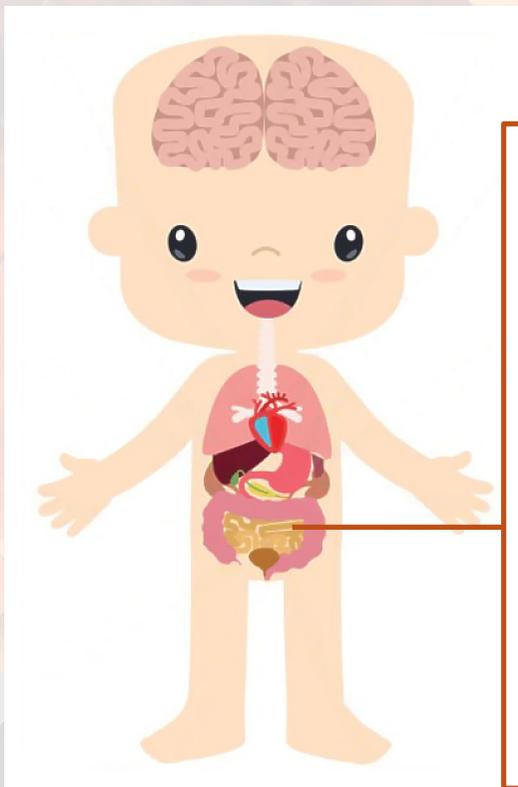

From birth till 44w GA ...

Cardiovascular

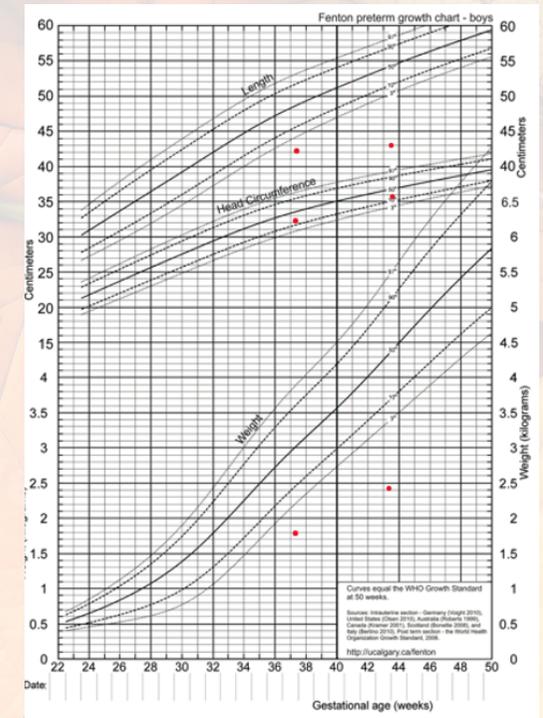

- Anatomy heart normal
- No pulmonary hypertension

From birth till 44w GA ...

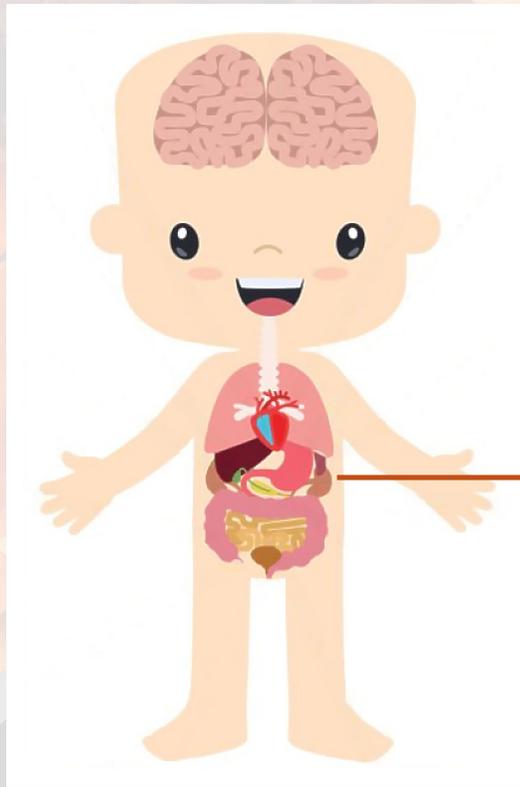

Gastro-intestinal

- Poor drinking → nasogastric tube
- Repeated regurgitations
→ Trial omeprazole: no improvement
→ ENT: mild GER
→ Continuous feeding
- Failure to thrive
→ Supplements of glucose and lipids
- X-ray: no obstruction, ultrasound: no signs of malrotation

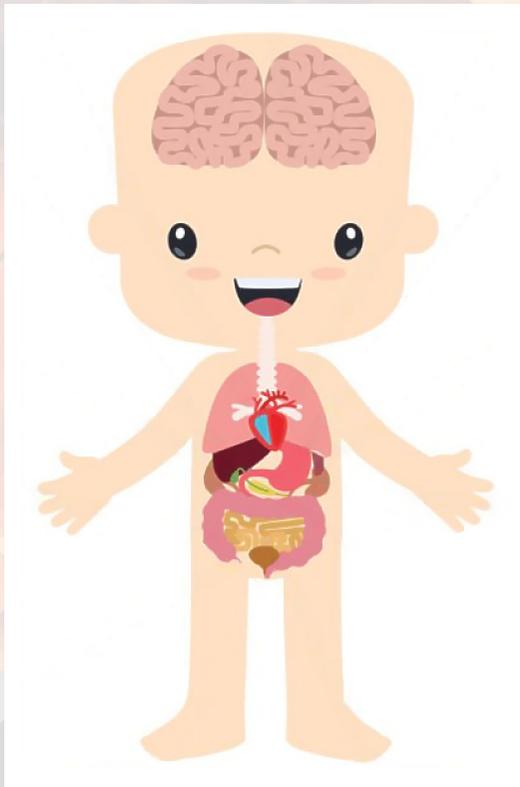

From birth till 44w GA ...

Renal & hepatic & metabolic

- Ultrasound vessie/kidneys/liver normal
- Blood normal kidney function, normal liver function
- Mild early hypocalcemia, treated with oral supplements
- 2x phototherapy, bilirubine max 18mg/dL

From birth till 44w GA ...

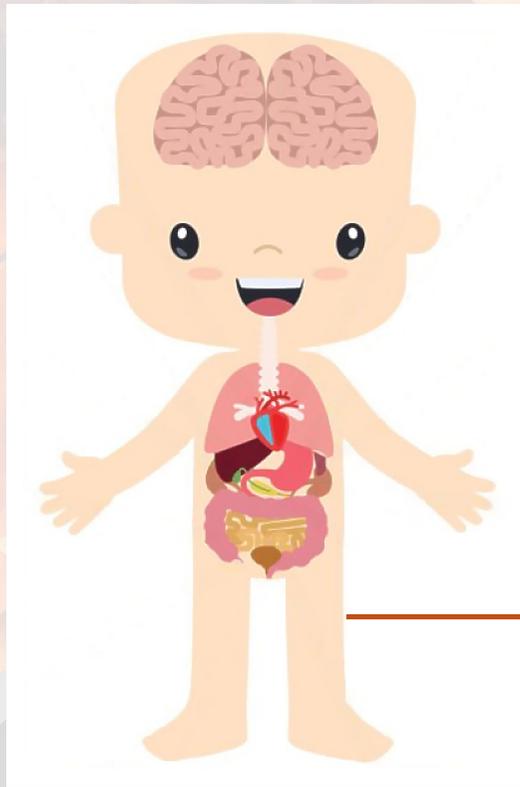

Infectious

- PCR CMV negatif

Hematology

- Normal

From birth till 44w GA ...

Orthopedic

- 3 weeks of plaster: no luxation anymore, no further need for plaster
- Ultrasound hips: normal
- No hyperlaxity

At 44w GA

- Persistent respiratory insufficiency
→ need for 24h non-invasive ventilation
- Persistent gastro-intestinal difficulties
→ probably need for gastrostomy
- **Transfer to paediatric ICU**

Diagnosis genetics

- CGH-array: normal male
- 21 genes analysed for thoracic dysplasia: normal
- Whole exome sequencing (WES) in trio

Diagnosis genetics (WES)

- **Homozygote** of variant c.1A>T, p.Met1? in gene **ORC 1**
- Both parents heterozygote carriers
- **Meier-Gorlin syndrome (autosomal recessive)**
- Mutation not yet described in literature

Meier-Gorlin syndrome

- Very rare, <100 cases described in literature
- Mutation in **ORC 1** and 12 other different genes described - loss of function
- Pathophysiology:
 - not well understood
 - disturbed DNA-replication → decreased cell proliferation → **diminished overall growth**
- Also called **ear-patella short stature** syndrome
- Characteristics:

Table 1 Clinical features of 35 individuals with Meier–Gorlin syndrome with biallelic mutations in one of the five pre-replication genes and 10 individuals with a clinical diagnosis of Meier–Gorlin syndrome without a definitive molecular diagnosis, including one individual with a monoallelic mutation in *ORC1* and two with a monoallelic mutation in *CDT1*

Clinical characteristics	Total (35 individuals)
Sex ratio M/F	14 M/21 F
Average age at examination	12 y 9 m
Range age at examination	3 m–47 y
Classical triad of clinical features	
Short stature (height for age < -2 SD)	31/35 (89%)
Microtia	34/35 (97%)
Patellar hypoplasia/aplasia	30/32 (94%)
Growth (represented in mean SD)	
Birth weight (SD range)	-3.8 SD (< -6.5 to -0.3)
IUGR (birth weight < -1.3 SD)	32/33 (97%)
Height at examination (SD range)	-4.4 SD (-9.6 to -0.4)
Weight at examination (SD range)	-3.9 SD (-9.3 to 0.8)
Head circumference (SD range)	-2.9 SD (-9.8 to 1.7)
Microcephaly (OFC for age < -3 SD)	13/29 (45%)
Disproportionate stature	4/17 (24%)
Facial features	
Abnormally formed ears	19/29 (66%)
Low-set ears	16/28 (57%)
Posteriorly rotated ears	7/17 (41%)
Convex nasal profile	7/14 (50%)
Narrow nose	8/16 (50%)
High nasal bridge	10/17 (59%)
Microstomia	18/29 (62%)
Full lips	21/30 (70%)
Micro-/retrognathia	25/29 (86%)
Downslanted palpebral fissures	9/17 (53%)
Neurological	
Intellectual disability	1/31 (3%)
Delayed motor development	6/32 (19%)
Delayed speech development	5/32 (16%)

Munnik et al. 2012

Respiratory insufficiency?

Respiratory tract

Respiratory problems during infancy	11/23 (48%)
Pulmonary emphysema	12/28 (43%)
Tracheomalacia	8/24 (33%)
Laryngomalacia	6/24 (25%)
Bronchomalacia	4/24 (17%)

- CT thorax: no signs of emphysema, otherwise normal
- ENT: no laryngomalacia
- No bronchoscopy done

Musculoskeletal anomalies

Delayed bone age	14/22 (64%)
Genu recurvatum	9/28 (32%)
Contractures/club feet	5/27 (19%)
Other	

- Suspicion of restrictive lung disease due to dysplastic small thorax

Literature?

- No patients described as severely affected as our case
- 4 lethal cases described with Meier-Gorlin, all 4 with lung emphysema

Literature?

- Slender ribs described, musculoskeletal dysplasia
- 1 case where a diagnosis of Jeune syndrome was suspected

Nazarenko et al. 2021

How is our patient doing in the meanwhile?

- **Deteriorating respiratory insufficiency** (CPAP → BIPAP)
- **No improvement on gastro-intestinal level**, poor drinking, need for naso-jejunal tube to control vomiting
- **Prognosis?** Based on actual clinic: **poor**.
- Difficult social situation
- Decision of **limitation of therapy**
- 3 weeks later, at the age of **3,5 months**: intestinal perforation (naso-jejunal tube)
- Pluridisciplinary decision not to operate, only comfort care → **passes away**

Take home messages

- **Meier-Gorlin:** IUGR-microtia – patellar hypo/aplasia
- IUGR and consanguinity → really 'just' IUGR?
- Importance of **publication** of (rare) cases

Thank you!

Dank u!

Merci!
